After the design has been entered—as a schematic or in a hardware description language—a process will be run called Boolean synthesis. Synthesizing a circuit out of a description, however,

The most basic aspect of face perception is simply detecting the presence of a face, which requires the extraction of features that it has in common with other faces. The effectiveness and ubiquity of the simple T-shaped schematic face (eye, eye, nose, mouth) suggest that face detection may be accomplished by a simple template-like process.
